- VoIP quite widespread as of now
 - Several solutions, standards and not
- Internet Engineering Task Force (IETF)
 - <http://www.ietf.org>
 - Standardized mostly everything on the Internet
 - HTTP, FTP, SMTP, POP3, IMAP, SNMP, etc.
 - Standardized suite of protocols for VoIP as well
 - Session Initiation Protocol (SIP)
 - Session Description Protocol (SDP)
 - Real-Time Transport Protocol (RTP)

PERC

- Session Initiation Protocol (SIP)
 - <http://tools.ietf.org/html/rfc3261>
 - Handles signalling (register, call, answer, hangup, ...)
- Session Description Protocol (SDP)
 - <http://tools.ietf.org/html/rfc3264>
 - Handles negotiation (media to involve, supported encodings and features, IP/ports, etc.)
- Real-Time Transport Protocol (RTP)
 - <http://tools.ietf.org/html/rfc3550>
 - Handles transport of media frames between peers

- Several security threats ¹
 - Interception and modification
 - Abuse of Service (fraud)
 - Interruption of Service (Denial of Service attacks)
 - Social attacks (SPAM over Internet Telephony)
- Hard to take care of them all
 - Several protocols/components/topologies involved
 - Completely different attacks

Where can we start?

Securing the protocols themselves!

¹VoIP Security: technology and challenges (S.Niccolini, NEC)

DTLS-SRTP

WebRTC

IdP

PERC

- SIP is usually transported clear-text over UDP
 - Simple, quick and effective, but...
 - ... it (and its SDP too) can be modified and/or intercepted!
- It can be used without authentication
 - Simple for PBX ²/IVR ³ scenarios, but again...
 - ... it can be easily exploited for fraud/abuse/DoS attacks!
- It can involve several components
 - A good thing, per se
 - It allows for a separation of responsibilities/concerns...
 - ... as long as you can trust them all!

SDES

DTLS-SRTP

WebRTC

IdP

PERC

- SIP can be transported over TLS as well
 - Pretty much as HTTPS works
 - Prevents interception/modification...
 - ... but is harder on proxies too
 - UDP != TCP, in terms of SIP usage and scalability
 - Several crypto sessions/contexts to be handled
- SIP supports authentication too
 - UA-Proxy using challenge (Digest/MD5)
 - It obviously works better if SIP channel is secured too
 - Registrar can implement backend the way it wants
 - Proxy-Proxy using TLS authentication (DNS)

SIP UA Authentication Example

SDS

DTLS-SRTP

WebRTC

IdP

PERC

- Securing SIP and SDP is only one step
 - What about the media transport?
- RTP, just as SIP, by default is sent in the clear
 - Securing SIP/SDP can make it harder to detect...
 - Negotiation parameters are encrypted
 - ... but wiretapping/eavesdropping is still possible!
 - Several tools available to make this really easy

- Not as easy as securing SIP
 - Might use RTP/TLS, but...
 - RTP is almost always transported over UDP
 - TCP not suitable for its real-time requirements
 - Might use RTP/IPsec, but...
 - Assumes IPsec is available (e.g., in a VPN ⁴)
 - A lot of overhead involved

Secure Real-time Transport Protocol (SRTP)

<http://tools.ietf.org/html/rfc3711>

- Extends RTP to make it “secure”
- Authentication, integrity, protection against replay

⁴Virtual Private Network

- Not as easy as securing SIP
 - Might use RTP/TLS, but...
 - RTP is almost always transported over UDP
 - TCP not suitable for its real-time requirements
 - Might use RTP/IPsec, but...
 - Assumes IPsec is available (e.g., in a VPN ⁴)
 - A lot of overhead involved

WebRTC

IdP
PERC

- Extension to standard RTP/RTCP
 - Encrypts payload, but **not** header
 - Advanced Encoding Scheme (AES)
 - Counter mode/f8, 128/192/256 bits
 - Authenticates the **whole** packet
 - HMAC-SHA1 32/80 (160)
 - Authentication + Message integrity
- Can have NULL cipher
 - Basically like RTP, but with hashing

Developed by J. Daemen and V. Rijmen

- Proposed in AES competition as Rijndael
 - Competition had specific requirements
 - Block length of 128 bits
 - Key lengths of 128, 192 and 256 bits
 - Easy to implement in hardware and software
 - Intended to replace Data Encryption Standard (DES)
- Standardized by National Institute of Standards and Technology (NIST) as FIPS 197 in 2001
 - Almost unbreakable
 - All attacks are just theoretical
 - Eventually replaced Data Encryption Scheme (DES)
 - U.S. Government Standard

Block cipher that works iteratively

- Operates several rounds on “states” (4x4 bytes)
 - 10 rounds needed when key is 128 bits (192/12, 256/14)
- Four steps for each round (except last)
 - SubBytes
 - Each byte of the 4x4 state is replaced (lookup table)
 - ShiftRows
 - Each row of the state matrix is left rotated (different positions)
 - MixColumns
 - The data in each column is mixed up (combination)
 - AddRound
 - Each column of the state is XORed with key schedule

Encryption/Decryption Scheme

WebRTC

IdP
PERC

- SRTP specifies how to encrypt packets...
 - ... but not how to exchange keys
- Several alternatives
 - MIKEY (Multimedia Internet KEYing)
 - <http://tools.ietf.org/html/rfc3830>
 - Ticket-Based system
 - Too complex for VoIP? (but used by 3GPP)
 - ZRTP (Zimmermann RTP)
 - <http://tools.ietf.org/html/rfc6189> (Informational!)
 - Focus on end-to-end (no need for PKI)
 - Diffie-Hellman on Media path (no need for encrypted signalling)

SRTP

Key Exchange

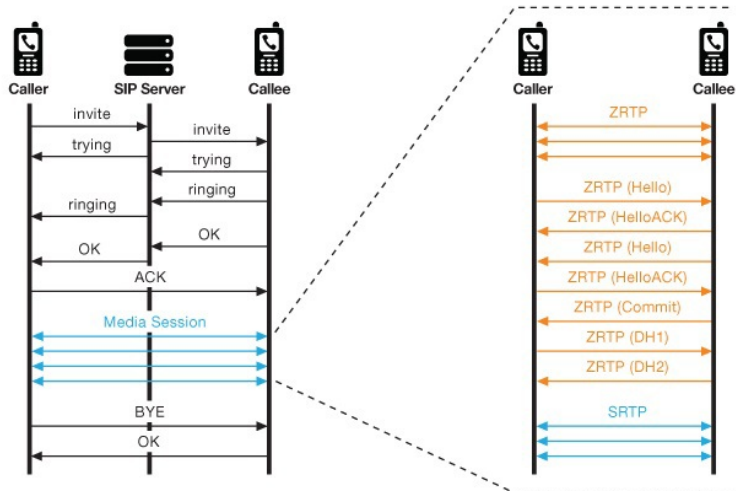

SDS

DTLS-SRTP

WebRTC

IdP

PERC

- SDES-SRTP (Secure Description)
 - <http://tools.ietf.org/html/rfc4568>
 - Simple, widespread
 - Exchanges keys in SDP (requires secure signalling)
- DTLS-SRTP (Datagram Transport Layer Security)
 - <http://tools.ietf.org/html/rfc5763>
 - Exploits DTLS, which is “like TLS” but for UDP
 - SDP transports certificate fingerprints (keys exchanged in DTLS)
- Hot topic in the IETF
 - RTPSEC BOF
 - <http://www.ietf.org/proceedings/68/rtpsec.html>
 - DTLS-SRTP was the “future”, is now the “present”

- Simple mechanism to negotiate parameters
 - Negotiation in SDP as additional a-line
`a=crypto:<tag> <crypto-suite> inline:<key||salt>
[session-parms]`
- Master key and salt provided inline
 - Concatenated and base64 encoded
- Supported crypto-suites (AES/SHA1 variations)
 - AES_CM_128_HMAC_SHA1_80
 - AES_CM_128_HMAC_SHA1_32
 - F8_128_HMAC_SHA1_32

SDES
DTLS-SRTP

WebRTC

IdP
PERC

- Recent standard, favourite in the IETF
 - But not very deployed at the moment...
- SRTP keys exchanged over DTLS
 - Ad-hoc extensions for SRTP keys
 - Media still SRTP! (DTLS **not** used as a transport)
- SDP does not contain keys
 - Cryptographic handshake over voice channel
 - Remember ZRTP?
 - Handshake authenticated via certificate fingerprint
 - Fingerprint is what is exchanged via SDP
 - Some additional parameters related to DTLS and roles
